

FORGE & FLOW

Project Cost Supporting Docs: Stack Pivot Patch

Entity: 98296 Newfoundland & Labrador Ltd. | Prepared 2026-04-23

Purpose

This patch PDF supersedes three pages of the original *ForgeFlow Project Cost Supporting Docs.pdf* following the backend stack pivot from Firebase / Firestore to Firebase Auth + Supabase Postgres + Google Cloud Run.

Pages in this patch

Page 3 (E05) Engineering labor (backend) — supersedes original page 3.

Page 4 (E06) Engineering labor (user accounts) — supersedes original page 4.

Page 14 (E24) Cloud hosting — supersedes original page 14.

Rationale

The pivot brings the data layer onto Supabase Postgres, enabling native graph queries (via Apache AGE extension), native vector search (via pgvector extension), and native SQL analytics for the operational KPIs and methodology knowledge graph the Forge & Flow advisor depends on. Firebase Auth is retained for its mature Flutter SDK and officially-supported OIDC integration with Supabase. Google Cloud Run hosts the MCP server and agent runtime. Budget totals are unchanged at \$200,000 CAD; only the Technologies Used descriptions are updated.

How to use this patch

Option A: Distribute this patch PDF alongside the original for the bank package. A reader who sees both documents will see the updated stack descriptions here.

Option B: Splice pages 1-3 of this patch into the original PDF at positions 3, 4, and 14 using a PDF editor (Adobe Acrobat, PDF-XChange, or similar).

Option C (recommended if source exists): Regenerate the full Supporting Docs PDF from the original authoring source (Microsoft Word, Google Docs, or other) using the updated descriptions from this patch for pages 3, 4, and 14.

E05

\$10,000 CAD

Engineering labor (backend)

Contracted engineers to build the backend foundation. Supabase Postgres schema with Apache AGE and pgvector extensions, Postgres Row-Level Security policies for per-operator data isolation, Cloud Functions or Supabase Edge Functions for admin operations, and Google Cloud Run for the MCP server and agent runtime need experienced implementation so customer data stays safe and the system scales cleanly.

This page supersedes page 3 of ForgeFlow Project Cost Supporting Docs.pdf. The Technologies Used column in the source xlsx has been updated in lockstep.

E06

\$5,000 CAD

Engineering labor (user accounts)

Contracted engineers to build the user account and authentication layer. Firebase Auth for identity, email and password login, password reset, and session persistence. Supabase Postgres with Row-Level Security for profiles, roles, and permission bundles, integrated with Firebase Auth via the officially-supported OIDC JWT pattern so every query carries authenticated scope. Together this is the foundation that lets each restaurant operate in their own secure space.

This page supersedes page 4 of ForgeFlow Project Cost Supporting Docs.pdf. The Technologies Used column in the source xlsx has been updated in lockstep.

Forge & Flow | Project Cost Supporting Docs | Stack Pivot Patch | 2026-04-23

E24

\$3,000 CAD
Cloud hosting

Cloud hosting across three integrated platforms. Firebase Auth provides identity and session management with mature Flutter SDK support. Supabase provides the Postgres database (with Apache AGE for knowledge graph and pgvector for semantic embeddings), Realtime sync for cross-device agreement layer, and file Storage. Google Cloud Run hosts the MCP server and agent runtime for the advisor. All three scale automatically as pilots come online.

This page supersedes page 14 of ForgeFlow Project Cost Supporting Docs.pdf. The Technologies Used column in the source xlsx has been updated in lockstep.
